

# Project Report: Atlantic Bridge Exchange

## 1. Technology & Tools Used

- Frontend Framework: React.js (Version 18)
- Build Tool: Vite (Ultra-fast compiler)
- Routing: React Router (HashRouter to prevent server errors)
- Animations: Framer Motion
- Multi-Language: React-i18next (Free local JSON translations)
- Icons: Lucide React

## 2. How to Build the Project

To compile the application, run the command:

```
npm run build
```

This creates a "dist" folder containing the highly optimized, minified production website.

## 3. Hosting & Server Architecture

- Server Type: Apache Web Server (Standard cPanel Hosting)
- Deployment: The "dist" folder is pushed to GitHub, which automatically deploys to the live server.
- Routing Fix: Because Apache servers expect physical folders, we used "HashRouter" (URLs like `/#/services`) to instantly resolve 404 Not Found errors.
